الرقم 9-20 خط كهربائي ممر أبراج 13/10 ، ، وPL القائمة.

الرقم 9-21 خط كهربائي ممر أبراج 10/08 ، ، وPL القائمة.

الرقم 9-22 خط كهربائي ممر أبراج 10/05

الرقم 9 - 23 خط كهربائي ممر أبراج 5-1

الملحق 2. الأنواع FLORA المحددة ضمن في خط كهربائي Jbel SENDOUQ AND THE ALIGMENT

The IUCN Red List Categories and Criteria are intended to be an easily and widely understood system for classifying species at high risk of global extinction.

The IUCN Red List is categorized in the following Categories:

- **Extinct (EX):** A taxon is Extinct when there is no reasonable doubt that the last individual has died. A taxon is presumed Extinct when exhaustive surveys in known and/or expected habitat, at appropriate times (diurnal, seasonal, annual), throughout its historic range have failed to record an individual. Surveys should be over a time frame appropriate to the taxon's life cycle and life form.

- **Extinct in the Wild (EW):** A taxon is Extinct in the Wild when it is known only to survive in cultivation, in captivity or as a naturalized population (or populations) well outside the past range. A taxon is presumed Extinct in the Wild when exhaustive surveys in known and/or expected habitat, at appropriate times (diurnal, seasonal, annual), throughout its historic range have failed to record an individual. Surveys should be over a time frame appropriate to the taxon's life cycle and life form.
- **Critically endangered (CR):** A taxon is Critically Endangered when the best available evidence indicates that it meets any of the criteria A to E for Critically Endangered, and it is therefore considered to be facing an extremely high risk of extinction in the wild.
- **Endangered (EN):** A taxon is endangered when the best available evidence indicates that it meets any of the criteria A to E for Endangered and it is therefore considered to be facing a very high risk of extinction in the wild.
- **Vulnerable (V):** A taxon is Vulnerable when the best available evidence indicates that it meets any of the criteria A to E for Vulnerable and it is therefore considered to be facing a high risk of extinction in the wild.
- **Near Threatened (NT):** A taxon is Near Threatened when it has been evaluated against the criteria but does not qualify for Critically Endangered, Endangered or Vulnerable now, but is close to qualifying for or is likely to qualify for a threatened category in the near future.
- **Least Concern (LC):** A taxon is Least Concern when it has been evaluated against the criteria and does not qualify for Critically Endangered, Endangered, Vulnerable or Near Threatened. Widespread and abundant taxa are included in this category.
- **Data Deficient (DD):** A taxon is Data Deficient when there is inadequate information to make a direct, or indirect, assessment of its risk of extinction based on its distribution and/or population status. A taxon in this category may be well studied, and its biology well known, but appropriate data on abundance and/or distribution are lacking. Data Deficient is therefore not a category of threat. Listing of taxa in this category indicates that more information is required and acknowledges the possibility that future research will show that threatened classification is appropriate. It is important to make positive use of whatever data are available. In many cases great care should be exercised in choosing between DD and a threatened status. If the range of a taxon is suspected to be relatively circumscribed, and a considerable period of time has elapsed since the last record of the taxon, threatened status may well be justified.
- **Not Evaluated (NE):** A taxon is Not Evaluated when it has not yet been evaluated against the criteria.

For more information about IUCN Red List Categories please check this [Link](#).

The following documents, *Catalogue Des Plantes Vasculaires Rares, Menacées Ou Endémiques Du Maroc*, (Fennane et al, 1998) and *Flore Vasculaire Du Maroc : Inventaire Et Chorologie* (Fennane et al, 2005), were used in order to specify each of the categories of flora species identified onsite.

The Catalogue (Fennane et al, 1998) classifies the degree of rarity with the following symbols:

- RR very rare; number of known locations <5
- RR? Suspected very rare.
- R? Suspected rare.
- R uncommon
- ?? Taxon suspected to be present.
- V vulnerable (or seems to be), decreasing and could become scarce in the short term.

Table Error! No text of specified style in document.-1 Flora species located within the study area.

IUCN RED LIST

Described in Annex 2

BIRDS DIRECTIVE

Directive 2009/147/EC of the European Parliament and of the Council of 30 November 2009 on the conservation of wild birds (this is the codified version of Directive 79/409/EEC as amended) is the EU's oldest piece of nature legislation and one of the most important, creating a comprehensive scheme of protection for all wild bird species naturally occurring in the Union. It was adopted unanimously by the Member States in 1979 as a response to increasing concern about the declines in Europe's wild bird populations resulting from pollution, loss of habitats as well as unsustainable use. It was also in recognition that wild birds, many of which are migratory, are a shared heritage of the Member States and that their effective conservation required international co-operation.

The species listed in Annex I of the Directive are the subject of special conservation measures to ensure their survival and reproduction in their area of distribution. These measures shall take account of:

- Species in danger of extinction;
- Species vulnerable to specific changes in their habitat;
- Species considered rare because of small populations or restricted local distribution;
- Other species requiring attention.

PHENOLOGY STATUS:

- MP: Passage Migrant
- H: Wintering
- A: Accidental
- ns: Present all year around, including Breeding

- nm: Breeding range, abandoned in winter
- no: Breeding occasionally
- npi & npa: Breeding not confirmed
- nc : Confirmed Breeding
